

Department of Computer Science & Engineering

Course Code: CSL37 TERM: Nov 2023 – Mar 2024

Course Name: Object Oriented Faculty In-charge: Jamuna S Murthy

Programing Laboratory

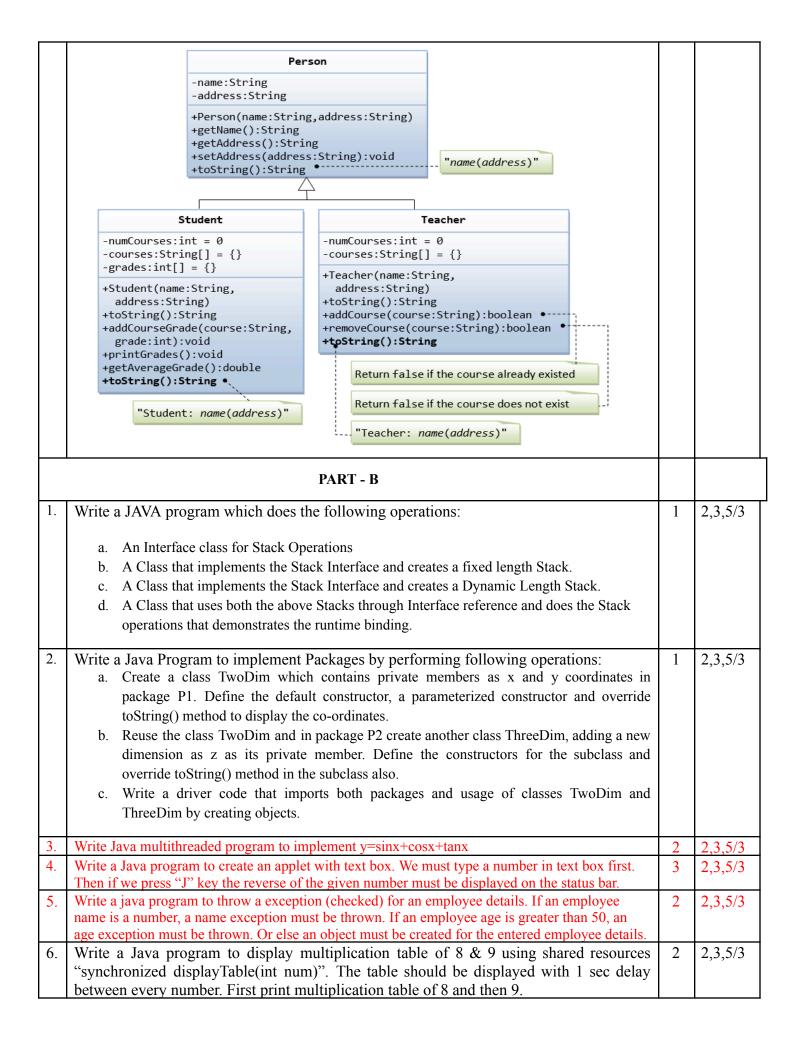

Credits: 0:0:1 SEMESTER: III

Design, develop, and implement the following programs in Java

			PART - A				СО	PO/PSO
1.	 Write a java program that demonstrate Method overriding: a. Create a class Bank that provides method to get the rate of interest called "getRateOfinterest() which is of type float. b. The rate of interest varies according to banks. SBI, ICICI and AXIS banks could provide 8%, 7%, and 9% rate of interest. c. Create Inheritance mechanism where SBI, ICICI and AXIS bank child classes extends Bank parent class that contains getRateOfinterest() method. d. Override getRateOfinterest() method in the child classes with updated interests as 8%, 7%, and 9%. e. Finally create a driver class BankDetails that can display the rate of interest of all the banks. 				1	2,3,5/3		
				terest() : float				
			,	extends				
		SBI	IC	ICI	AX	IIS		
		getRateOfInterest() : float	getRateOfInt	terest() : float	getRateOfInt	erest() : float		
2.	 Write a Java Program that does the following related to Inheritance: 1. Create an abstract class called 'Vehicle' which contains the 'hashelmet', 'year of manufacture' and two abstract methods 'getData()' and 'putData()'. Demonstrate the error when attempt is made to create objects of 'Vehicle'. 2. Have two derived classes 'TwoWheeler' and 'FourWheeler'. 'FourWheeler' is a final class. Demonstrate the error when attempt is made to inherit from 'FourWheeler'. 3. Your abstract class should haveoverloadedconstructors that initializes 'hashelmet' and 'year of manufacture for TwoWheeler and FourWheeler respectively. 4. 'TwoWheeler' has data elements 'Brand', 'Cost', 'EngineType' (possible values "2 stroke", "4 stroke"), and 'Color' which are private, protected, 'friendly/default' and public respectively. Demonstrate the various ways in which the two abstract methods can be dealt 'getData()' and 'putData()' can be dealt with by the derived classes, 'TwoWheeler' and 'FourWheeler'. 				1	2,3,5/3		

3.	 Write a Java Program that does the following: a. Create an abstract class called 'Shape' which contains Two instance variables color (String) and filled (boolean). Two constructors: a no-arg (no-argument) constructor that initializes the color to "green" and filled to true, and a constructor that initializes the color and filled to the given values. Getter and setter for all the instance variables. By convention, the getter for a boolean variable xxx is called isXXX() (instead of getXxx() for all the other types). A toString() method that returns "A Shape with color of xxx and filled/Not filled". An abstract method getArea() Demonstrate the error when attempt is made to create objects of 'Shape'. b. Write two subclasses of Shape called Circle and Rectangle. Rectangle is a final class. Demonstrate the error when attempt is made to inherit from 'Rectangle'. c. Write a class called Square, as a subclass of Rectangle. Convince yourself that Square can be modeled as a subclass of Rectangle. Square has no instance variable, but inherits the instance variables width and length from its superclass Rectangle. 	1	2,3,5/3
4.	 Write a Java Program that does the following a. Create a superclass, Student, and two subclasses, Undergrad and Grad. b. The superclass Student should have the following data members: name, ID, grade, age c. The superclass, Student should have at least one method: Boolean isPassed (double grade) d. The purpose of the isPassed method is to take one parameter, grade (value between 0 and 100) and check whether the grade has passed the requirement for passing a course. In the Student class this method should be empty as an abstract method. e. The two subclasses, Grad and Undergrad, will inherit all data members of the Student class and override the method isPassed. For the UnderGrad class, if the grade is above 70.0, then isPassedreturns true, otherwise it returns false. For the Grad class, if the grade is above 80.0, then isPassed returns true, otherwise returns false. f. Demonstrate "final" keyword in the above class. g. Create a test class for your three classes. In the test class, create one Grad object and one Undergrad object. For each object, provide a grade and display the results of the isPassed method. 	1	2,3,5/3
5.	Write a Java Program that does the following a. Create a super class called Car. The Car class has the following fields and methods. • int speed; double regularPrice; String color; double getSalePrice(); b. Create a sub class of Car class and name it as Truck. The Truck class has the following fields and methods. • int weight; double getSalePrice(); • //Ifweight>2000,10% discount. Otherwise,20% discount. c. Create a subclass of Car class and name it as Ford. The Ford class has the following fields and methods • int year; intmanufacturerDiscount; double getSalePrice(); • //From the sale price computed from Carclass, subtract the manufacturer Discount. d. Create a subclass of Car class and name it as Sedan. The Sedan class has the following fields and methods. • int length; double getSalePrice(); • //If length>20feet, 5% discount, Otherwise, 10% discount.	1	2,3,5/3

1		utoShop class which contains the main() method. Perform the following			
	within the main(): • Create an				
	Use super				
	• Create an				
	values				
	• Use super() method in the constructor for initializing the fields of the super class.				
	• Create an instance of Car class and initialize all the fields with appropriate values. Display the sale prices of all instances.				
6.		m that implements the following	1	2,3,5/3	
0.	 Define a class Sav 	1	2,3,3/3		
	• Use a static var				
	holders.				
	Private data mer	mber savingsBalance indicating the amount the saver currently has on			
	deposit.				
	 Method calculate 	eMonthlyInterest to calculate the monthly interest as (savingsBalance			
	* annualInteres	tRate / 12). After calculation, the interest should be added to			
	savingsBalance.				
		odifyInterestRate to set annualInterestRate.			
		onstructor with savingsBalance as an argument to set the value of that			
	instance.				
		avingsAccount to instantiate two savingsAccount objects, saver1 and balances of Rs.2000.00 and Rs3000.00, respectively. Set			
		balances of Rs.2000.00 and Rs3000.00, respectively. Set ate to 4%, then calculate the monthly interest and print the new			
		th savers. Then set the annualInterestRate to 5%, calculate the next			
		and print the new balances for both savers.			
7.		•	-		
	i write a Java Prograf	m that does the following	1 1	12.3.5/3
